Why Does This Problem Exist?

Delayed Diagnosis

Millions of patients worldwide delay seeking medical help due to lack of awareness, cost barriers, or unavailability of doctors — leading to preventable complications.

Overburdened Healthcare

Hospitals in developing countries face extreme patient overload. Preliminary screening tools can reduce unnecessary visits and direct critical cases to urgent care faster.

Low Health Literacy

Most people cannot map their symptoms to diseases without professional help. A smart, accessible tool bridging this gap can empower early, informed decision-making.

What MediScan AI Aims to Achieve

Accurate Prediction

Use Random Forest ML with 40 diseases and 17 symptoms for high-accuracy preliminary diagnosis.

Natural Language Chat

Allow users to describe symptoms in plain English or Hindi; AI maps text to conditions instantly.

Multilingual Access

Support English and Hindi to make the tool accessible to a diverse, non-technical population.

Visual Insights

Provide confidence scores, severity ratings, and interactive dashboards for data-driven awareness.

Downloadable Reports

Generate structured health reports users can share with a doctor for informed consultations.

Real-Time Response

Deliver instant results with no server round-trips — runs fully local, offline-ready.
